

Visualizations:

Partial Dashboard(kept crashing my computer and wouldn't resize when i tried both manual and automatic):

## Reflection:

1. Based on the visualizations I made, the main thing I realized was that the leading CO2 emission countries in the world are all nations that have well-established infrastructure. Countries like the United States have many factories and vehicles contributing to increased CO2 emissions. Comparing this figure to smaller nations shows a significant difference in CO2 output. The visualization that helped me understand this the best was the bar chart. Simple visuals are always helpful because I can associate a big bar with a high percentage or number much more easily than with more complex visualizations.

2. I enjoyed working with Tableau as the interface is user-friendly and it's pretty simple to use. I would enjoy working on future data analysis projects with Tableau.
